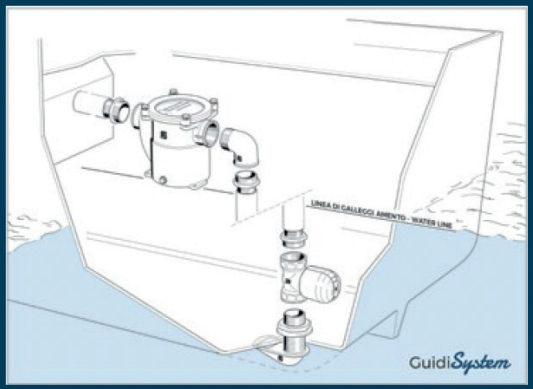
The Guidi System


The Italian marine accessories company Guidi has released a new patented kit to increase the performance of water flow through the yacht's hydraulic systems. The system maintains efficiency and consists of a water intake, non-stick valve and water strainer, helping to reduce pressure drops, avoid air-bubbles and allows for longer-lasting hydraulic systems. The water intake, non-stick valve and strainer control the water flow from outside to the inside of the hull where it cools down the engine.
